

# STEPCONVEXITY

Updated: 31 Mar 2016

Use **STEPCONVEXITY** to calculate the convexity for a stepped-coupon bond. Convexity is defined as the second derivative of price with respect to yield divided by the dirty price of the bond multiplied by 100.

$$CONVEXITY = \frac{\frac{\partial^2 P}{\partial y^2}}{P_{dirty} * 100}$$

## Syntax

```
Public Shared Function STEPCONVEXITY(  
    ByVal Settlement As Date,  
    ByVal Maturity As Date,  
    ByVal Yld As Double,  
    ByVal Redemption As Double,  
    ByVal Frequency As Double,  
    ByVal Basis As String,  
    ByVal Coupons As String,)
```

## Arguments

### *Settlement*

the settlement date occurring within a coupon period of the bond. *Settlement* is an expression that returns a **Date**, or of a type that can be implicitly converted to **Date**.

### *Maturity*

the maturity date of the bond. *Maturity* is an expression that returns a **Date**, or of a type that can be implicitly converted to **Date**.

### *Yld*

the yield for the maturity date passed into the function. *Yld* is an expression that returns a **Double**, or of a type that can be implicitly converted to **Double**.

### *Redemption*

the redemption value of the bond assuming a par value of 100. *Redemption* is an expression that returns a **Double**, or of a type that can be implicitly converted to **Double**.

### *Frequency*

the number of coupon payments per year. For annual payments, *Frequency* = 1; for semi-annual, *Frequency* = 2; for quarterly, *Frequency* = 4; for monthly *Frequency* = 12. *Frequency* is an expression that returns a **Double**, or of a type that can be implicitly converted to **Double**.

### *Basis*

the type of day count to use.

<u>Basis</u>	<u>Day count basis</u>
0 or omitted	US (NASD) 30/360
1	Actual/Actual
2	Actual/360
3	Actual/365
4	European 30/360

*Basis* is an expression that returns a **String**, or of a type that can be implicitly converted to **String**.

#### *Coupons*

a SELECT statement, as a string, which identifies the coupon dates and rates to be used in the duration calculation. The coupon rate is assumed to be in effect from the associated coupon date to the next greater coupon date returned by the SELECT statement. The last rate is assumed to be in effect from the last date until the maturity date of the bond. *Coupons* is an expression that returns a **String**, or of a type that can be implicitly converted to **String**.

## Return Type

Double

## Remarks

- If *Basis* < 0 or *Basis* > 4 an error is returned.
- If *Maturity* < *Settlement* 0 is returned.
- If *Settlement* is NULL, *Settlement* equals the current processing date.
- If *Frequency* is NULL, *Frequency* = 2.
- If *Basis* is NULL, *Basis* = 0.
- If *Coupons* is empty or NULL then coupon rate is assumed to be zero.
- Accrued interest is calculated from the previous coupon date to the settlement date.
- Previous coupon date is calculated backwards from the maturity date. If the maturity date is the last day of the month, all the previous coupon dates are assumed to occur on the last day of the month.
- Previous coupon date <= *Settlement* < next coupon date
